

Web Hosting

Fast, dependable and secure hosting for your website

- Fast page loads
- Highly available platform
- Support 24 hours a day
- One-click migration
- Enterprise-grade security as standard
- 100% green hosting

Autoscaling hosting

Resources are adjusted automatically as your traffic changes, so pages stay quick during busy periods. Traditional hosting confines you to one server with fixed limits. Here there are no LVE caps, so your site isn't held back by arbitrary resource ceilings.

Security you don't have to configure

Real-time DDoS filtering, a smart web application firewall and scheduled malware scans protect your sites without slowing them. Every hosted domain gets a free SSL certificate for encrypted connections.

Ready for business

The platform meets PCI standards, so it is suitable for online stores that take card payments.

Built-in global CDN

A free content delivery network caches your pages at the edge and serves them from the location closest to each visitor, which cuts delay worldwide. With image and code optimization included, you get speed without piling on extra plugins.

Designed for high availability

There are no single points of failure. Automatic failover and redundant systems across a distributed network keep services running, and load-balanced resources help your sites stay up during traffic peaks or hardware faults.

More than 80 one-click installs

Launch a shop, blog or portfolio in minutes with one-click installs of WordPress, Joomla!, Magento, PrestaShop and dozens of other applications.

Green by design

The whole platform runs on 100% renewable energy, with a very low power usage effectiveness (PUE) rating.

Real people for support

Support is staffed by experienced developers and technicians. There are no chatbots and no escalation tiers. From complicated migrations to advanced configuration, you talk to someone who knows the platform.

StackCP control panel

StackCP is our own control panel. Create FTP accounts, schedule cron jobs, manage databases and install any of the 80+ apps, and handle DNS, SSL certificates and email accounts in bulk from one place.

Tuned for speed

Autoscaling PHP workers prevent bottlenecks when many requests arrive together. Combined with all-SSD storage, a global CDN and server-level tuning, your sites respond faster and can serve an unlimited number of visitors at once.

Migration without the hassle

Use the Migration Centre to copy files, databases and email from your current host. Downtime is kept to a minimum and no data is lost.

High-frequency option

Requires Website Turbo to be enabled.

High-frequency hosting runs on CPUs with faster clock speeds, which process more instructions each second. Pages load sooner and stay responsive at peak times, and CDN pre-caching speeds things up further. It is aimed at businesses that need both power and dependability.

Frequently Asked Questions

What is autoscaling?

Autoscaling raises or lowers the CPU, memory and bandwidth your sites use according to live traffic, so they stay responsive during busy periods with nothing for you to do.

How does one-click migration work?

Give us the login details for your current host and the Migration Centre copies your website, databases and email across, with no data loss and minimal downtime.

What security is in place?

DDoS protection, a web application firewall, malware scanning and two-factor authentication, plus free SSL certificates on every site. The platform is PCI compliant for ecommerce.

Are resources limited per account?

No. There are no LVE limits. CPU and memory scale with demand rather than being capped.

Is it suitable for business sites?

Yes. It is built for business use, with PCI compliance, autoscaling and enterprise-level security, which suits online stores and other sites where reliability matters.
